React Exercises
Add Two Numbers

Create a React application that will have three-component :

1. The Parent Component will render two child components , this component will have a state value to show the result in the child component, and will have the callback function for the onClick event, you need to pass these (the result value, callback function) to children components.

2. Add two numbers components, that will take the values of the numbers from the user and will fire that onClick event.

3. Show Result component, which will show the result of the adding operation in the h1 element.

** you should use Props drilling to pass the value from the parent component to the child component.

You can see the photo below to help you with page design:
